Ovid[®] Nursing Edge Quick Reference Card

Sort your full text search results by relevance or date by using the tools on the left. You can also limit your search results by subject, language, publisher, author and many other variables. Filter by whether results are full-text or have been peer-reviewed. When you select a filter, it refreshes the results and displays above the search box.

Ovid Nursing Edge uses the MeSH thesaurus and the Nursing@Ovid Thesaurus, and includes an American English/UK English spell check system.

Osteogenic melanoma: report of a case mimicking osteosarcoma and review of the literature Savant, Deepika, Kenan, Shachar, et al, *Skeletal Radiology* (volume 47, issue 5, pages 711-716) 🧿 , 5/1/2018

DESCRIPTION

ISSN: 0364-2348 EISSN: 1432-2161

A 32-year-old male presented with a right thumb lesion of 11-month duration. A clinical diagnosis of progenic granutoma was entertained but the lesion failed to respond to conservative therapy and eventually necessitated amputation of his thumb. INRi of the right thumb showed an il-defined, heterogeneously enhancing, infiltrating mass within the dorsal set tissues abuting the distal phatama and measuring of 2 + 2 4 + 0.7 cm. Histologically, the thumor was composed of a high-grade osteosarcoma with a chondrosarcomatous component localized within the underlying bone and a more superficial spindle cell component in the overlying soft tissue. The epidermis was focally ulcerated overlying the lesion. The key to the diagnosis was provided by interse stating of the spindle cell component for \$100 protein indicality of a spindle cell a dinal diagnosis of osteogenic ascornatous component established a final diagnosis of osteogenic melanoma. The localized on of this element to phalangeal bone is distinctly unusual and resulted in the close resemblance to a primary osteogenic sarcoma.
